How to use AI responsibly in your business

Have you ever stopped to think about how much your business relies on AI already?

Maybe it's without you even noticing?

AI is quietly becoming part of everyday work life. From the smart tools that help with emails or customer support, to apps that analyze trends or boost productivity.

But with great power comes great responsibility.

Using AI isn't just about getting tasks done faster. It's about making smart, ethical choices that protect your people, your customers, and your reputation. That means being clear on how AI is being used in your business. And making sure it's being used the right way.

Responsible AI starts with understanding. Not everyone on your team needs to be a tech expert, but they should know the basics.

Like how to protect data, share sensitive information, and spot when something doesn't seem right. Good training is key, especially as AI becomes more involved in decision making.

It also means thinking about fairness and accountability. If an AI tool is helping to make decisions – perhaps sorting resume or recommending products – you need to be confident it's not introducing bias or making errors. Someone in your business should always be responsible for double checking its work. AI can assist, but it shouldn't replace human judgment.

Creating simple, clear guidelines for your team is a great place to start.

Be open about how you're using AI and why. Make sure people know what's okay and what's not, especially when it comes to data. And regularly review how your AI tools are performing, so you can catch any problems early.

Done well, AI can give your business a real edge. But only if it's used thoughtfully, transparently, and with care.

If you want to explore how AI can help your business (and how to manage it responsibly), we'd love to help. Get in touch.

DID YOU KNOW...

you can change your mouse scrolling settings?

Want to tweak how your mouse scrolls in Windows 11?

It's simple.

Head over to **Settings > Bluetooth & devices > Mouse.**

Here, you can adjust how many lines the wheel scrolls or opt to scroll a full screen at a time. You can also enable scrolling in inactive windows by hovering over them. Perfect for multitasking.

And if the scroll direction feels off, there's an option to reverse it to your preference. Smoother navigation in no time.

TechFacts

- 1** In 2014, hackers used a refrigerator to send spam emails. Yes, a refrigerator. It was part of a botnet made up of smart devices like TVs and thermostats that were online but poorly protected. Even toothbrushes aren't safe these days. It just shows that as more gadgets get "smart," they also need to get secure.
- 2** The computers that sent astronauts to the moon had just 64KB of memory. That's less than a basic calculator today. Now, every time you Google something, it uses more computing power than NASA had for the entire Apollo mission. We've gone from rocket science to rocket-speed search results in just one click.
- 3** Scientists have found a wild new way to store data: DNA. Yep, the same stuff that makes you. You could one day hold all the world's digital info. Just one gram of DNA can store 215 million gigabytes. In theory, we could fit the entire internet in a shoebox... made of science.

Technology update

No more Blue Screen of Death?

Heard of the Blue Screen of Death?

Of course you have. It's the screen you see when your PC crashes.

Well, it's getting a makeover. It used to be blue (hence the name), then green for testers. But now it might be black for everyone.

Microsoft's changing the color to match the sleeker look of Windows 11. But some people say it's confusing because it looks like normal update screens.

Either way, if your screen suddenly goes black with an error message, don't panic, it's still doing the same thing... just with a new coat of paint.

INSPIRATIONAL QUOTE OF THE MONTH

*"Technology
should improve
your life... not
become your life."*

Billy Cox, ex-director at Intel.

NEW TO

MICROSOFT

Keep your Windows 11 Start menu tidy

Windows 11 just made it
easier to tidy up your
Start menu.

Now, when you right click
a pinned app, you can
move it left or right
without dragging it
around. It's handy if
you're picky about your
layout. You can also
create folders or move
apps between them right
from the menu.

It's a small update, but it
makes organizing your
apps quicker and less
fiddly. If you like your
Start menu neat, this
update's for you.

A new month means a new fun tech quiz...

1. Which popular video-sharing platform was originally created as a dating site?
2. Which company created the Android operating system?
3. What is the name of a type of malware that locks your files and demands money to unlock them?
4. What was the most used emoji in 2024?
5. What does "incognito mode" do in a browser?

The answers are below.

1. YouTube
2. Google (after acquiring it in 2005)
3. Ransomware
4. 🤔 or Loudly Crying Face
5. Stops your browsing history from being saved on your device

Think paying the ransom will fix everything? Think again

Imagine logging into your system one morning and finding everything locked down.

A message demands thousands to get your data back.

The pressure is intense.

The temptation to just pay up and move on is real.

But here's the hard truth: Paying the ransom doesn't guarantee anything. And it often makes things worse.

Ransomware attacks are on the rise, and they're only getting smarter. These days, it's not just about locking up your files. Attackers also steal your data and threaten to leak it unless you pay. They'll even go after your backups, so you can't just restore and carry on.

Many business owners think paying the ransom is the quickest way to get back to normal. But it's rarely that simple.

Studies show that the true cost of recovering from a ransomware attack is ten times higher than the ransom itself.

That's because even after you pay, there's no guarantee you'll get all your data back. Or that it hasn't been tampered with. You could still face weeks of downtime, lose customer trust, or get hit with regulatory fines if sensitive information is leaked.

And then there's the bigger picture. Every ransom paid helps fund the next attack. It's a vicious cycle. The more profitable ransomware becomes, the more motivated cyber criminals are to keep going... and keep improving their techniques.

So, is there a better approach?

Yes.

Focus on recovery, not ransom. That means investing in strong, secure backups that can't be touched by ransomware. It means regularly testing your recovery plans. Training your team to respond quickly. And making sure your systems can be restored safely if disaster strikes.

You can't always stop ransomware from getting in. But you can make sure it doesn't stop your business.

My team and I can help your business with that. [Get in touch.](#)

Business gadget of the month

WACACO Minipresso portable espresso machine

What is a workplace without coffee? Unproductive, that's what.

Office coffee doesn't have the best reputation though. Unless you've invested in a state of the art coffee machine for your break room.

If you haven't, this portable espresso machine is the next best thing. It's handheld, lightweight and operated with a pump action. And it brews a great coffee while looking good at the same time. Think about how much more productive you'll be if you're not dashing across the street to the coffee shop a few times a day.

\$54.90 from Amazon.

Q: Do we need cyber insurance?

A: It's a good safety net, especially if you handle sensitive data. But please remember that it's not a replacement for good security practices.

Q: Is storing files in the cloud safe?

A: Yes, if it's a trusted provider and you use strong security settings like multi-factor authentication. If you want advice on the best cloud solution for your business, get in touch.

Q: How often should we review our IT security?

A: Regular reviews are essential – that's at least once a year. But do it sooner if your business changes or if new threats appear.

This is how you can get in touch with us:
